                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AL Submitted (13-MAY-2003) BD Biosciences Clontech, 1020 East Meadow Circle, Palo Alto, CA 94303, USA
This CDS clone is a part of a collection of human full length expression clones generated by BD Biosciences Clontech and the Harvard Institute of Proteomics. Each CDS has been cloned in two forms: with and without stop-codon (to allow fusion with C-terminal tag). The CDS has been directionally cloned using BD In-Fusion(TM) cloning system between the Sall and HindIII sites of the pDNR-DUAL vector. Additional sequences in the clone: 'ACC' after Sall site and before 'ATG' to provide Kozak consensus sequence; 'GG' after last codon and before HindIII site to maintain reading frame. Clone distribution: http://bioinfo.clontech.com/orfclones.

This CDS clone is a part of a collection of human full length
expression clones generated by BD Biosciences Clontech and the
Harvard Institute of Proteomics. Each CDS has been cloned in two
forms: with and without stop-codon (to allow fusion with C-terminal
tag). The CDS has been directionally cloned using BD In-Fusion(TM)
cloning system between the SalI and HindIII sites of the pDNR-DUAL
vector. Additional sequences in the clone: 'ACC' after SalI site
and before 'ATG' to provide Kozak consensus sequence; 'GG' after
last codon and before HindIII site to maintain reading frame.
Clone distribution: http://bboinfo.clontech.com/orfclones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (bases 1 to 1986)

2 (bases 1 to 1986)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       source
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chrl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cambridgeshire, CB10 1SA, UK. Allen, N.,

Research

NOTE: This is a 'working draft' sequence. It currently consists of 31 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence

as soon as it is available and the accession number will be preserved.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

and is derived by analysis of the total score distribution.

Nucleotide sequences encoding the immunogenic peptides may be used as primers and probes in the detection of melanoma cells. Tumour infiltrating lymphocytes capable of binding to the melanoma associated antigen can be cultured av vivo and returned to melanome particles, and when radiolabelled, they may be used to identify

                                                                                                                                                                                                                                                                                                                                                                                                                                                           polynucleotides are referred to as a Savine. The synthetic polypeptide is useful for modulating immune responses preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone liver, oesophagus, brain, testicle, uterus), as potentiating agents. Compositions comprising the polypeptide may be used in the treatment or prophylaxis, against viral (such as infections caused by HIV (human immunodeficiency virus), hepatitis, influenza, Japanese encephalitis virus, Epstein-Barr virus and respiratory syncytial virus), bacterial (e.g., infections caused by Neisseria, Meningococcal, Haemophilus, Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked together in a different relationship relative to their linkage in the parent polypeptide to impede, abrogate or otherwise alter at least one function associated with the parent polypeptide and for inducing an immune response against a pathogen or cancer and included are a synthetic polymeleotide encoding and a computer system for designing the synthetic polypeptides. The synthetic polypeptides and polymeleotides are referred to as a Savine. The synthetic polypeptide polymeleotides are referred to as a Savine. The synthetic polypeptides

Also included are a CC synthetic polynucleotide encoding and a computer system for designing the synthetic polypeptides. The synthetic polypeptides and CC polynucleotides are referred to as a Savine. The synthetic polypeptide is CC useful for modulating immune responses preferably directed against a CC pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix, CC colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone Cliver, oesophagus, brain, testicle, uterus), as potentiating agents. CC compositions comprising the polypeptide may be used in the treatment or prophylaxis against virus and respiratory syncytial virus), bacterial (e.g., infections caused by Neisseria, Meningococcal, Haemophilus, CC Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic CC Trypanosoma, Toxoplasma and Giardia) infections. The present

                                                                                                                                                                                                                                                                                                                              tumour-associated antigens (TAAs), such as GPI00 and carcinoembryonic antigen (CEA) in an animal. The method involves priming of the animal with an inducing agent such as tetanus toxoid (TT) or diphtheria toxoid (DT), subsequently followed by administration of an inducing agent antigen mixture. The method provides the enhancement or augmentation of the immune response to the antigen and/or improves a vaccination protocol by allowing use of less antigen. The immunisation of the animal with tumour-associated antigen is useful for the prophylactic or therapeutic treatment of cancer. The present DNA sequence encodes modified tumour-associated antigen, GP100 related to the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (Macaca fascicularis) were injected with a modified form of gp100 antigen (a) into the left inguinal lymph node or (b) subcutaneously. Both animals (c) of (a) developed a cell-mediated response (indicated by production of collection of therferon-gamma from T lymphocytes when exposed to gp100 peptides), but (c) interferon-gamma from T lymphocytes when exposed to gp100 peptides), but (c) colly 2 of 4 animals of (b) did so. Also animals in (a) produced a far (c) greater antibody response to gp100. The method is used in immunotherapy (c) of a wide range of cancers through induction of a specific immune (c) cresponse (humoral and cellular) against the tumour antigens. When administered to a lymphatic site, Ag (or (I)) induces a stronger immune (c) consistered to a lymphatic site, Ag (or (I)) induces a stronger immune (c) consistered to a lymphatic site, Ag (or (I)) induces a stronger immune (c) consistered to a lymphatic site, Ag (or (I)) induces a stronger immune (c) consistered to a lymphatic site, Ag (or (I)) induces a stronger immune (c) consistered to a lymphatic site, Ag (or (I)) induces a stronger immune (c) consistered to a lymphatic site, Ag (or (I)) induces a stronger immune (c) antigen protein given and AAB97709 represent gp100 epitopes; AAB97710 to (c) AAB97815 represent peptides derived from gp100 which stimulate interferon (c) (IFN)-gamma production; AAH20121 encodes the modified carcinoembyonic antigen (CEA) (c) protein given in AAB97817; and AAB97818 represents a CEA modified antigen (CEA) (c) protein given in AAB97817; and AAB97818 represents a CEA modified antigen (CEA) (c) protein given in AAB97817; and AAB97818 represents a CEA modified antigen (CEA) (c) protein given in AAB97817; and AAB97818 represents a CEA modified antigen (CEA) (c) protein given in AAB97817; and AAB97818 represents a CEA modified antigen (CEA) (c) protein given in AAB97817; and AAB97818 represents a CEA modified antigen (CEA) (c) protein given in AAB97818 represents a CEA modified antigen (CEA) (c) protein given in AAB97818 
                                              Sequence encoding melanoma associated antigen gpl00.

The immunogen is produced by the cells and processed so that the target protein or its fragment is presented to the patients immune system and a cellular immune response is initiated. The method and vectors can be used as a form of vaccination and could be used to generate a cellular immune response in patients to, e.g. cancerous tumours. The cellular immune response in the predominant immune response in the patient. This sequence represents a DNA fragment which encodes the human tumour antigen gp100 described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Generating cellular immune response in patient to target protein - comprises introducing vector with nucleotide sequence encoding immunogen comprising protein processing signal into cell of patient
Human melanoma antigen gp100 coding sequence.

These peptides are useful for inducing an immune response in a subject, where they are delivered in the context of an MHC molecule which presents the compound on the surface of an antigen presenting cell. The peptide sequences are useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for cancers characterized by expression of the melanoma antigen gp100. They are useful for diagnosis and treatment of diseases such as cancer. In particular against human melanoma and for antiparticular against human melanoma and for the perfect of the second 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence encodes human melanoma antigen gp100. Peptides of the invention based on the sequence of residues 209-217 of human melanoma antigen gp100, which represents the putative HLA-A2 binding domain, are designed to enhance binding to major histocompatibility complex (MHC) molecules and to enhance immunoregulatory properties relative to their natural counterparts. The mutations in the claimed peptides confer tighter binding to the MHC. These peptides are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel synthetic compounds useful for stimulating an immune response a subject and as components of anti-cancer vaccines, are designed to enhance binding to major histocompatibility complex molecules -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 2130
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Major histocompatibility complex; MHC; human; melanoma antigen; gp100; HLA-A2 binding domain; mutation; antigen presenting cell; vaccine; immune effector cell; cancer; antibody; ss.

                                                                                                                                                                                                                                                                                  polynucleotides that encode these compounds, and immune effector cells that have been raised in vitro or in vivo in the presence of an antigen presenting cell (APC) that presents the compound. Such an APC may be the major histocompatibility complex (MHC) molecule. The anti-melanoma compounds are useful for inducing an immune response in a subject, by delivering the compound to the subject in the context of an MHC molecule which presents the compound on the surface of an APC. The anti-melanoma compound is delivered as a polynucleotide that encodes it. The compounds are useful to generate antibodies that specifically recognise and bind to them, for the treatment of melanoma, as components of anti-cancer vaccines, and to expand immune effector cells that are specific for cancers characterised by expression of gp100 tumour antigen, melanoma. The compounds are also useful in diagnostic methods for such diseases.

CC The present sequence encodes human melanoma antigen gp100.

New isolated and purified gp100 useful for the prophylactic treatment

Ş

of.

Example

2; Fig

3; 89pp; English.

The present invention describes an isolated and purified modified gp100 molecule (gp100M) capable of modulating an immune response in an animal. gp100M has cytostatic activity and can be used in vaccine production and gene therapy. Nucleic acids and proteins of the invention are useful as vaccines for prophylactic treatment of cancer. AAH22084 to AAH32106 and AAH38009 to AAH38206 represent sequence used in the exemplification of the present invention. More specifically AAH38098 to AAH382105 represent primers used in the present and AAH22100 to AAH22099 represents the plasmid nucleotide sequence comprising the Vaccinia virus H6 promoter and the human gp100 gene; and AAH22098 encodes the human gp100 gene; and AAH22098 generals gp100 gene; and AAH22098 generals gp100 gene; and AAH22098 generals gp100 generals g

CC several different segments of at least one parent polypeptide linked coparent polypeptide to impede, abrogate or otherwise alter at least one communication associated with the parent polypeptide and for inducing an actimum response against a pathogen or cancer. Also included are a commune response against a pathogen or cancer. Also included are a commune response against a pathogen or cancer. Also included are a commune response against a pathogen or cancer. Also included are a commune response against a pathogen or a cancer couseful for modulating immune responses preferably directed against a cuseful for modulating immune responses preferably directed against a colon, head and neck pancreas, prostate, stomach, bladder, kidney, bone colon, head and neck pancreas, prostate, stomach, bladder, kidney, bone colon, head and neck pancreas, prostate, stomach, bladder, kidney, bone colon, head and neck pancreas, prostate, stomach, bladder, kidney, bone compositions comprising the polypeptide may be used in the treatment or prophylaxis against viral (such as infections caused by HIV (human compositions caused by Netsetrial colons). The prostate caused by Netsetrial colons caused by Plasmodium, Schistosoma, Leishmania, colons caused by Plasmodium, colons caused by Plasmodium,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a new synthetic polypeptide (I) comprising

Antigen cDNA25 is a source of immunogenic peptides (see AAR84199) which are optionally modified (see AAR84200-R84211) and used in medicaments, especially vaccines, for the treatment or prevention (by immunization) of melanoma. Antibodies against CDNA25 and its immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 2172

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          therapeutic methods as an immunogen or vaccine to prevent or treat melanoma, and for in vivo tumour recognition and rejection. AAS455:
AAS45528 represent WART-1 coding sequences, PCR primers, and relating sequences of the invention.
                                                                      Immunogenic peptides derived from the melanoma associated antigen (See AR78639-45) may be used in the production of vaccines. Nucleotide sequences encoding the immunogenic peptides may be used as primers and probes in the detection of melanoma cells. Tumour infiltrating lymphocytes capable of binding to the melanoma associated antigen can be cultured ex vivo and returned to melanoma particles, and when radiolabelled, they may be used to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     21-DEC-1994;

        CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polymecleotides are also used in diagnostics as expressed sequence tags (CC polymucleotides are also used in diagnostics as expressed sequence tags (CC iri). (II) is useful in gene therapy techniques (CC to restore normal activity of (II) or to treat disease states involving CC (II). (II) is useful for generating antibodies against it, detecting or creating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC and to produce other types of data and products dependent on DNA and CC anino acid sequences. AAS64197-AAS94564 represent novel human CC diagnostic coding sequences of the invention.

CC Specification, but was obtained in electronic format directly from WIPO captures and the printed of the process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            US-09-214-836-2 (1-9) x

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  US-09-214-836-2 (1-9) x AAS80038 (1-3669)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               So X
cc polypeptide (II) sequences. (I) is useful as hybridisation probes, cc polymerase chain reaction (PCR) primers, oligomers, and for chromosome cc and gene mapping, and in recombinant production of (II) The cc polymucleotides are also used in diagnostics as expressed sequence tags cc for identifying expressed genes. (I) is useful in gene therapy techniques ct orestore normal activity of (II) or to treat disease states involving cylindrical control of (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical considers involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in cc diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity amino acid sequences. AAS64197-AAS94564 represent novel human cc diagnostic coding sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   31-MAR-2000; 2000US-0540217.
23-AUG-2000; 2000US-0649167.
                                                                                                                                                                                                                                                           The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes

       The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations.
                                                                                                                                                                                                                                                                                                                   New isolated polynucleotide and encoded polypeptides, useful diagnostics, forensics, gene mapping, identification of muta responsible for genetic disorders or other traits and to assuresponsible for genetic disorders or other traits.
                                                                                                                                                                                                                                                                       Claim 1;

                     The invention relates to identifying a candidate p53 pathway modulating agent that involves assaying a purified LCE (long chain fatty acyl elongase) polypeptide or nucleic acid or its functionally active fragment or derivative, with a test agent. The methods are useful for identifying a candidate p53 pathway modulating agent, modulating a p53 pathway of a cell, or a mammalian cell, diagnosing a disease in a patient, identifying a candidate branching morphogenesis modulating agent, and modulating branching morphogenesis in a mammalian cell. The diseases that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printer specification, but was obtained in electronic format directly from was at ftp.wipo.int/pub/published_pct_sequences.

                                 libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                        The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             25% expression level. The method is useful for manufacturing a for diagnosing or treating breast, colon, lung or ovary cancer. ABZ24215-222 represent DNA sequences related to human LCE gene.
